Application Name

Rocket Powered Goblins (RPG Templates)

Application Description

Our application is a modular system to design, share, and use character sheets for any TTRPG you can dream of. Users can essentially program their own dynamic template with drag-and-drop fields like stats, skills, inventories, spell lists, and notes, with calculated values that update automatically. Sheets save to a personal account so players and game masters can pull them up on a laptop, tablet, or phone at the table.

Any user can publish a template to the public library, and any other player can jump in, copy a generous creator's template, tweak it to fit their campaign or homebrew rules, and be ready to play in minutes instead of rebuilding a sheet from scratch. The core value is saving time and replacing scattered notes, rigid pre-made sheets, and generic spreadsheets with one flexible system. The initial scope covers account creation, the template builder, saving and editing character sheets, and the public library with search, sharing, and moderation. Real-time multiplayer editing, publisher integrations, and native mobile apps are outside the initial scope and could be future work.

Audience

Our target audience is hobbyist gamers who play board games and tabletop roleplaying games. These users juggle multiple games at once, and each one comes with its own rules, stats, and terminology that are hard to track in scattered notes or rigid, pre-made sheets. Our software solves this with a customizable template system for building spec sheets tailored to any game, whether that's a TTRPG character sheet or a build planner for a video game.

Vision Statement

“To provide a community with a Usable, Sharable, Modular system to reduce the complexity of tabletop roleplaying games and make them accessible to consumers.”

Version Control

Github: https://github.com/MadelineSmithSchool/SystemsandMethodsGroupProject

Developmental Methodology

We will be using a waterfall methodology. Our tasks will be clearly defined and the goalposts will not move much, so this will be the easiest way to streamline work between many active contributors.

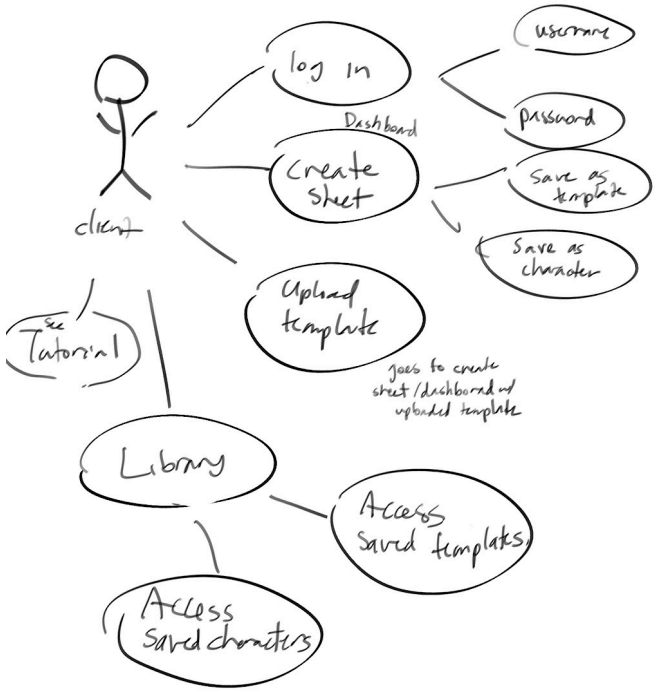

Communication Plan

We plan on using a Discord Server (https://discord.gg/Se4RcD3rE) to communicate with each other. Communication will be sorted into different channels and have efficient access.

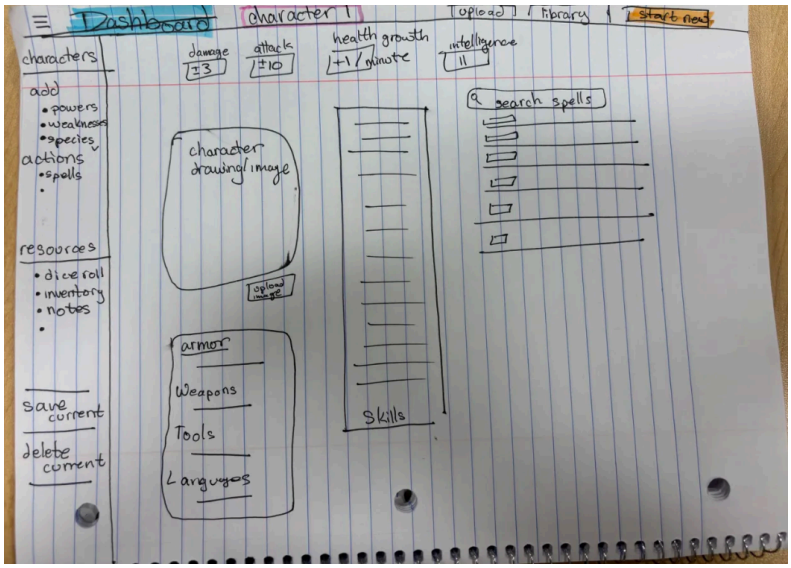

Meeting Plan

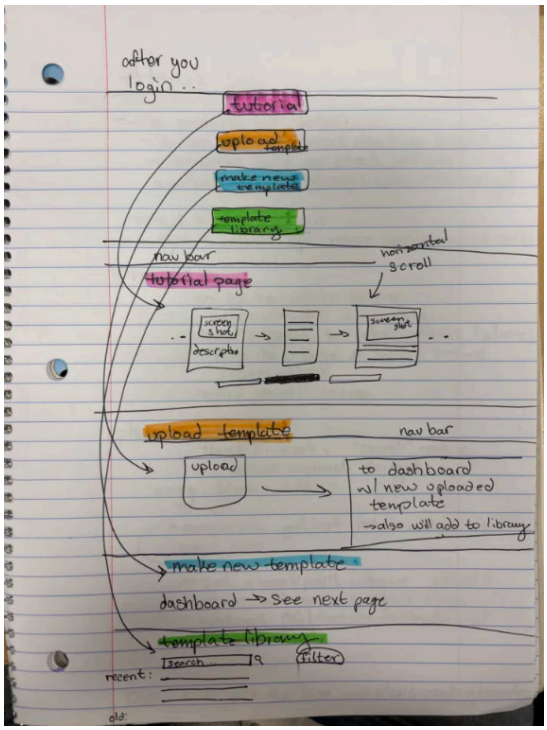

- **Team meeting:** We will be meeting as a group without our TA at 8:45 AM on Tuesdays via Zoom
- **Weekly meeting with TA:** We will be meeting as a group with our TA at 1:45 PM on Mondays via Zoom.

Extra Credit - Five Potential Risks

- **1. SQL Injection**
  Severity: High. A successful injection could expose or destroy user accounts. Mitigation: use parameterized queries and validate input server-side.
- **2. Cross-Site Scripting (XSS)**
  Severity: High. Malicious scripts in shared templates could run in other users' browsers. Mitigation: escape and sanitize all user content on output.
- **3. Server and Database Overload from Spam**
  Severity: Medium to High. Flooding the library with junk could fill storage and slow the app for everyone. Mitigation: rate limit uploads, require verified accounts, monitor for abnormal spikes.
- **4. Hate Speech and Harmful Content**
  Severity: Medium. Offensive uploads could harm users and put harmful information online. Mitigation: publish community guidelines, use keyword filtering.
- **5. Copyright Infringement**
  Severity: Medium to High. Uploads of copied rulebook text or official art could expose us to legal claims. Mitigation: require users to confirm they own their uploads, offer a DMCA-style takedown process.
